1 Introduction

The 'jabber:iq:private' namespace has previously been documented in the Jabber Programmers Guide, but not in a canonical form such as the Internet-Drafts or a XEP. This specification documents the existing usage of jabber:iq:private.

2 jabber:iq:private Namespace

2.1 Description

A Jabber client can store any arbitrary XML on the server side by sending an <iq/> stanza of type "set" to the server with a <query/> child scoped by the 'jabber:iq:private' namespace. The <query/> element MAY contain any arbitrary XML fragment as long as the root element of that fragment is scoped by its own namespace. The data can then be retrieved by sending an <iq/> stanza of type "get" with a <query/> child scoped by the 'jabber:iq:private' namespace, which in turn contains a child element scoped by the namespace used for storage of that fragment. Using this method, Jabber entities can store private data on the server and retrieve it whenever necessary. The data stored might be anything, as long as it is valid XML. One typical usage for this namespace is the server-side storage of client-specific preferences; another is Bookmark Storage (XEP-0048)¹.

2.2 Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get</td>
<td>Sent with a blank query to retrieve the private data from the server.</td>
</tr>
<tr>
<td>set</td>
<td>Sent with the private XML data contained inside of a query.</td>
</tr>
<tr>
<td>result</td>
<td>Returns the private data from the server.</td>
</tr>
<tr>
<td>error</td>
<td>There was an error processing the request. The exact error can be found in the child error element.</td>
</tr>
</tbody>
</table>

2.3 Elements

The root element of this namespace is query. At least one child element with a proper namespace MUST be included; otherwise the server MUST respond with a "Not Acceptable" error (see Error Condition Mappings (XEP-0086)² for information about error conditions). A client MUST NOT query for more than one namespace in a single IQ get request. However, an IQ set or result MAY contain multiple elements qualified by the same namespace.

**Listing 1: Client Stores Private Data**

**CLIENT:**

```
<iq type="set" id="1001">
  <query xmlns="jabber:iq:private">
    <exodus xmlns="exodus:prefs">
      <defaultnick>Hamlet</defaultnick>
    </exodus>
  </query>
</iq>
```  

**SERVER:**

```
<iq type="result"
    from="hamlet@shakespeare.lit/denmark"
    to="hamlet@shakespeare.lit/denmark"
    id="1001"/>
```  

**Listing 2: Client Retrieves Private Data**

**CLIENT:**

```
<iq type="get" id="1002">
  <query xmlns="jabber:iq:private">
    <exodus xmlns="exodus:prefs"/>
  </query>
</iq>
```  

**SERVER:**

```
<iq type="result"
    from="hamlet@shakespeare.lit/denmark"
    to="hamlet@shakespeare.lit/denmark"
    id="1002">
  <query xmlns="jabber:iq:private">
    <exodus xmlns="exodus:prefs">
      <defaultnick>Hamlet</defaultnick>
    </exodus>
  </query>
</iq>
```  

If a user attempts to get or set jabber:iq:private data that belongs to another user, the server MUST return a "Forbidden" or "Service Unavailable" error to the sender (the latter condition is in common use by existing implementations, although the former is preferable).

**Listing 3: User Attempts to Get or Set Data for Another User**

**CLIENT:**

```
<iq type="set" to="hamlet@shakespeare.lit" id="1003">
  <query xmlns="jabber:iq:private">
    <exodus xmlns="exodus:prefs">
      <defaultnick>Macbeth</defaultnick>
    </exodus>
  </query>
</iq>
```
<query xmlns="jabber:iq:private">
  <exodus xmlns="exodus:prefs">
    <defaultnick>Macbeth</defaultnick>
  </exodus>
</query>

<error code="403" type="cancel">
  <forbidden xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
</error>
</iq>

If a user attempts to perform an IQ get without providing a child element, the server SHOULD return a "Bad Format" error (however, some existing implementations return a "Not Acceptable" error in such circumstances):

Listing 4: User Attempts to Get Data Without Specifying Child Element/Namespace

CLIENT:
<iq type="set" id="1004">
  <query xmlns="jabber:iq:private"/>
</iq>

SERVER:
<iq type="error" id="1004">
  <query xmlns="jabber:iq:private"/>
  <error code="406" type="modify">
    <bad-format xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>

Certain namespaces are reserved in Jabber (namespaces beginning with 'jabber:' or 'http://jabber.org/', as well as 'vcard-temp'). If a user attempts to get or set jabber:iq:private data in a reserved namespace, historically some server implementations have chosen to return an error (commonly "Not Acceptable") to the sender. Such behavior is OPTIONAL, but may be encountered by clients when interacting with some existing server implementations.

Listing 5: User Attempts to Get or Set Data in a Reserved Namespace

CLIENT:
3 Error Conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bad Format</td>
<td>The IQ get does not contain a child element.</td>
</tr>
<tr>
<td>Forbidden</td>
<td>The IQ get or set is sent to a JID other than that of the sender.</td>
</tr>
<tr>
<td>Not Acceptable</td>
<td>The IQ get or set is qualified by a reserved namespace.</td>
</tr>
</tbody>
</table>

4 Security Considerations

A server MUST NOT allow any entity other than an authorized resource of the user to create, update, or delete private XML stored on behalf of that user.

5 IANA Considerations

This document requires no interaction with the Internet Assigned Numbers Authority (IANA) \(^3\).

\(^3\)The Internet Assigned Numbers Authority (IANA) is the central coordinator for the assignment of unique parameter values for Internet protocols, such as port numbers and URI schemes. For further information, see [http://www.iana.org/](http://www.iana.org/).
6 XMPP Registrar Considerations

No action on the part of the XMPP Registrar[^1] is necessary as a result of this document, since 'jabber:iq:private' is already a registered namespace.

7 XML Schema

```xml
<?xml version='1.0' encoding='UTF-8'?>
<xs:schema
  xmlns:xs='http://www.w3.org/2001/XMLSchema'
  targetNamespace='jabber:iq:private'
  xmlns='jabber:iq:private'
  elementFormDefault='qualified'>
  <xs:annotation>
    <xs:documentation>
      The protocol documented by this schema is defined in
      XEP-0049: http://www.xmpp.org/extensions/xep-0049.html
    </xs:documentation>
  </xs:annotation>
  <xs:element name='query'>
    <xs:complexType>
      <xs:sequence minOccurs='0'>
        <xs:any namespace='##other'/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

[^1]: The XMPP Registrar maintains a list of reserved protocol namespaces as well as registries of parameters used in the context of XMPP extension protocols approved by the XMPP Standards Foundation. For further information, see <https://xmpp.org/registrar/>.
