1 Introduction

RFC 3920 introduced the concept of binding a resource to an XML stream (this concept superseded part of the obsolete jabber:iq:auth protocol described in Non-SASL Authentication (XEP-0078) \(^1\)). As defined in RFC 3920, resource binding enables a client to bind one resource to a stream but does not enable a client to unbind a resource and leaves underspecified what a server and client should do if a client binds more than one resource to a stream. Because the ability to bind multiple resources to a stream is desirable in certain environments (e.g., for devices that are unable to open more than one TCP connection or when a machine runs a daemon process that is used by multiple applications), this document proposes improvements to resource binding in order to address these shortcomings.

Note: The recommendations from this document were NOT incorporated into RFC 6120 \(^2\) and this document is Obsolete.

2 Unbinding a Resource

In order to properly manage the resources associated with an XML stream, a client must be able to unbind resources. This shall be completed by sending an IQ-set with a child element of `<unbind/>` qualified by the `urn:ietf:params:xml:ns:xmpp-bind` namespace, which in turn has a child element of `<resource/>` whose XML character data specifies the resource to be unbound:

\[
<\text{iq from='someid@domain.tld/someresource' type='set' id='bind_2'}>
  <\text{unbind xmlns='urn:ietf:params:xml:ns:xmpp-bind'}>
    <\text{resource}>someresource</\text{resource}>
  </\text{unbind}>
</\text{iq}>
\]

If the server does not understand the `<unbind/>` element, it MUST return an error of `<bad-request/>`. Otherwise, if there is no such resource, the server MUST return an error of `<item-not-found/>`. When the client unbinds the only resource associated with the stream, the server SHOULD close the stream and terminate the TCP connection. The `from` address included in bind and unbind stanzas SHOULD be the full JID `<localpart@domain.tld/resource>` associated with the resource in question; however, the server MUST NOT accept further stanzas from that full JID after successfully processing the unbind request.

A server SHOULD advertise its support for the `urn:ietf:params:xml:ns:xmpp-bind` namespace and the unbind functionality by returning an appropriate stream feature as shown below:

\[
<\text{stream:features}>
  <\text{bind xmlns='urn:ietf:params:xml:ns:xmpp-bind'}>
    <\text{required} />
  </\text{bind}>
</\text{stream:features}>
\]

4 EXAMPLES

```xml
<bind />
<unbind xmlns='urn:ietf:params:xml:ns:xmpp-bind'/>
</stream:features>
```

3 Business Rules

3.1 From Addresses

When a client binds multiple resources to the same stream, proper management of 'from' addresses is imperative. In particular, a client MUST specify a 'from' address on every stanza it sends over a stream to which it has bound multiple resources, where the 'from' address is the full JID `<localpart@domain.tld/resource>` associated with the relevant resource. If a client does not specify a 'from' address on a stanza it sends over a stream to which it has bound multiple resources (or if it specifies as the 'from' address a full JID other than one of the bound resources), the server MUST return the stanza to the client with an `<unknown-sender/>` stanza error.

Naturally, the existing rules from RFC 3920 regarding validation of asserted 'from' addresses still apply.

3.2 Server Sessions

In instant messaging and presence applications, an XMPP server manages a session on behalf of a connected client. A server MUST create and manage a separate session for each distinct resource, even if there are multiple resources associated with a given XML stream. In particular:

1. A server MUST consider each resource to be a distinct source of presence information, both with regard to presence notifications and with regard to presence probes.

2. A server MUST manage rosters (see RFC 3920) and Privacy Lists (XEP-0016) separately for each resource.

4 Examples

The following examples show a possible flow of resource binding and unbinding (stanzas prefixed by "C:" are sent by the client, stanzas prefixed by "S:" are sent by the server).

First, the client binds an initial resource to the stream.

---

3 Currently there is no `<unknown-sender/>` stanza defined in RFC 3920. The author will work to add such an error condition (with a type of "modify") to the document that revises RFC 3920.

Now the client sends some stanzas, making sure to set its 'from' address:

Listing 2: Sending Some Stanzas

Now the client binds a second resource to the stream.

Listing 3: Binding a Second Resource

If the server does not allow entities to bind multiple resources to the stream, it MUST return a <not-allowed/> error as described in RFC 3920.

Now the client sends more stanzas.
In handling the last stanza shown above, the server returns an <unknown-sender/> error to the sender because the sender did not include a 'from' address.

Now the client binds a third resource to the stream.

Now the client unbinds its initial resource.
5  Security Considerations

If properly implemented, the modifications described herein do not introduce any new security concerns above and beyond those defined in RFC 3920. However, care must be taken to properly manage 'from' addresses in order to avoid the delivery of stanzas from an unintended resource (which may, for example, leak presence information).
6 IANA Considerations

No interaction with the Internet Assigned Numbers Authority (IANA) is required as a result of this document.

7 XMPP Registrar Considerations

No interaction with the XMPP Registrar is required as a result of this document, since the 'urn:ietf:params:xml:ns:xmpp-bind' namespace is already registered (see <https://xmpp.org/registrar/namespaces.html>).

8 XML Schema

Note: The following provisional schema is intended to replace the existing schema for the Resource Binding stream feature.

```xml
<?xml version='1.0' encoding='UTF-8'?>
<xs:schema
    xmlns:xs='http://www.w3.org/2001/XMLSchema'
    targetNamespace='urn:ietf:params:xml:ns:xmpp-bind'
    xmlns='urn:ietf:params:xml:ns:xmpp-bind'
    elementFormDefault='qualified'>

    <xs:element name='bind'>
        <xs:complexType>
            <xs:sequence>
                <xs:choice minOccurs='0' maxOccurs='1'>
                    <xs:element name='resource' type='resourceType'/>
                    <xs:element name='jid' type='fullJIDType'/>
                </xs:choice>
                <xs:element name='required'
                    minOccurs='0'
                    maxOccurs='1'
                    type='empty'/>
            </xs:sequence>
        </xs:complexType>
    </xs:element>
</xs:schema>
```

---

5 The Internet Assigned Numbers Authority (IANA) is the central coordinator for the assignment of unique parameter values for Internet protocols, such as port numbers and URI schemes. For further information, see <http://www.iana.org/>.

6 The XMPP Registrar maintains a list of reserved protocol namespaces as well as registries of parameters used in the context of XMPP extension protocols approved by the XMPP Standards Foundation. For further information, see <https://xmpp.org/registrar/>.
```xml
<xs:schema>
  
  <xs:element name='unbind'>
    <xs:complexType>
      <xs:sequence minOccurs='0'>
        <xs:element name='resource' type='resourceType'/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>

  <xs:simpleType name='resourceType'>
    <xs:restriction base='xs:string'>
      <xs:minLength value='1'/>
      <xs:maxLength value='1023'/>
    </xs:restriction>
  </xs:simpleType>

  <xs:simpleType name='fullJIDType'>
    <xs:restriction base='xs:string'>
      <xs:minLength value='8'/>
      <xs:maxLength value='3071'/>
    </xs:restriction>
  </xs:simpleType>

</xs:schema>
```
