1 Introduction

Although message threads are re-used in XMPP extension protocols such as Chat State Notifications (XEP-0085)\(^1\), best practices for generating and handling message threads have never been well specified (e.g., in RFC 3921\(^2\) or RFC 6121\(^3\)). This document attempts to clearly specify those matters for implementation by XMPP clients.

2 Motivation

Threads matter because they enable XMPP clients to:

- Track conversation topics within the context of a one-to-one chat session, a Multi-User Chat (XEP-0045)\(^4\) room, or exchange of normal messages.
- Restart a conversation from message history.
- Enable clients to distinguish between different conversation threads when presenting a user’s message, chat, and groupchat histories, thus providing a more coherent user interface (e.g. by collapsing threads to a single history entry).
- Separate logical sessions from physical interface objects such as windows.
- Route XMPP stanzas within a client (e.g., dispatching different content types to different windows), thus facilitating the creation of more robust plugin architectures.

3 Generation

3.1 Inclusion

Depending on the type of the message (i.e., the value of the `type` attribute), the `<thread/>` should be included as follows:

<table>
<thead>
<tr>
<th>Message Type</th>
<th>Inclusion</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat</td>
<td>RECOMMENDED</td>
</tr>
<tr>
<td>groupchat</td>
<td>RECOMMENDED</td>
</tr>
<tr>
<td>headline</td>
<td>OPTIONAL</td>
</tr>
<tr>
<td>normal</td>
<td>OPTIONAL</td>
</tr>
</tbody>
</table>

3.2 New Threads

Unless a <message/> stanza is written in direct reply to another <message/> stanza, if a ThreadID is included then its value SHOULD be newly generated when a human user initiates a chat conversation with another user (i.e., a <message/> stanza of type 'chat'), starts a new conversation in the context of a multi-user chat environment (i.e., a <message/> stanza of type 'groupchat'), or sends a normal message. If the <message/> stanza is written in direct reply to another <message/> stanza, then the ThreadID SHOULD be the value from the the original <message/> stanza. (Determining what constitutes a <message/> stanza written in reply to another is a matter left to individual implementation, but it is envisaged that in most cases it would be the result of, e.g., the user clicking a 'reply' button when reading the contents of the previous stanza.)

3.3 Child Threads

In some situations, the conversation veers from the original topic. In this situation, it can be sensible to generate a new thread that is an offshoot or child of the original thread. The connection of the child thread to the parent thread is indicated by including the original ThreadID as the value of the 'parent' attribute.

Listing 1: Thread with parent

```xml
<message
    to='romeo@example.net/orchard'
    from='juliet@example.com/balcony'
    id='asiwe82891jfdalk'
    type='chat'
    xml:lang='en'>
    <body>Art thou not Romeo, and a Montague?</body>
    <thread parent='7edac73ab41e45c4aaaf7b749080'>
        e0ffe42b28561960c6b12b944a09394b683a38
    </thread>
</message>
```

4 Handling

In general, the XMPP <thread/> element is handled in a manner similar to the "References:" header field from email (see RFC 5322) and netnews (see RFC 5536), as well as the THREAD

---

extension to IMAP (see RFC 5256). Detailed guidelines for particular XMPP message types are provided in the following sections.

4.1 Chat Messages

For <message/> stanzas of type "chat" exchanged between two entities, the value of the <thread/> element shall be considered equivalent to a unique identifier for the chat session or conversation thread. If an entity receives such a message with a new or unknown ThreadID, it SHOULD treat the message as part of a new chat session. A client MAY destroy the thread when it goes offline, but SHOULD NOT destroy the thread if a human user merely disengages from the chat session (e.g., by closing a window in a client interface).

If an entity receives an XMPP presence stanza of type "unavailable" from the other entity during a chat session, it SHOULD NOT destroy the thread; instead, it SHOULD assume that the other entity will still be able to continue the session (perhaps the other entity was temporarily disconnected by a network error or is persisting the state of the session until it reconnects and receives "offline" messages).

If an entity receives a message of type "chat" without a thread ID, then it SHOULD create a new session with a new thread ID (and include that thread ID in all the messages it sends within the new session).

4.2 Groupchat Messages

For <message/> stanzas of type "groupchat" exchanged between multiple entities in a Multi-User Chat (XEP-0045) room or similar environment, the value of the <thread/> element shall be considered equivalent to a unique identifier for a conversation thread in the multi-user environment.

When displaying a threaded groupchat conversation within a user interface, a client SHOULD provide a visual indication of the thread to which a message belongs. Methods for such indications include (non-exhaustively) the grouping together of all messages from the same thread, providing an index of threads, or formatting all messages within a thread in a cohesive manner, e.g. with uniform coloring.

4.3 Normal Messages

For <message/> stanzas of type "normal", the value of the <thread/> element shall be considered equivalent to a unique identifier for a conversation thread that proceeds outside the context of a "real-time" chat session or groupchat session.

When displaying threaded messages of type "normal" within a user interface, a client SHOULD

---

provide a visual indication of the thread to which a message belongs. Methods for such indications include (non-exhaustively) the grouping together of all messages from the same thread, providing an index of threads, or formatting all messages within a thread in a cohesive manner, e.g. with uniform coloring.

4.4 Headline Messages

There are no special handling requirements related to threads for `<message/>` stanzas of type "headline", because it is not expected that a client will allow the recipient to reply to such messages.

4.5 Messages That Have Been Archived

When displaying historical conversations within a user interface, a client SHOULD provide a visual indication of the thread to which a message belongs. Methods for such indications include (non-exhaustively) the grouping together of all messages from the same thread, providing an index of threads, or formatting all messages within a thread in a cohesive manner, e.g. with uniform coloring.

5 Security Considerations

Several security considerations related to XMPP threads are described in RFC 6121.

6 IANA Considerations

This document requires no interaction with the Internet Assigned Numbers Authority (IANA) 9.

7 XMPP Registrar Considerations

This document requires no interaction with the XMPP Registrar 10.

---

9The Internet Assigned Numbers Authority (IANA) is the central coordinator for the assignment of unique parameter values for Internet protocols, such as port numbers and URI schemes. For further information, see <http://www.iana.org/>.

10The XMPP Registrar maintains a list of reserved protocol namespaces as well as registries of parameters used in the context of XMPP extension protocols approved by the XMPP Standards Foundation. For further information, see <https://xmpp.org/registrar/>.
