This specification defines an XMPP extension for tightly coupled conference calls. It allows users who participate in multiparty Jingle calls via a focus agent (mixer) to retrieve information and receive notifications about the state of the call and the other participants. This extension is also meant to provide a straightforward way of connecting SIP and XMPP clients to the same conference room.

Copyright

This XMPP Extension Protocol is copyright © 1999 – 2024 by the XMPP Standards Foundation (XSF).

Permissions

Permission is hereby granted, free of charge, to any person obtaining a copy of this specification (the "Specification"), to make use of the Specification without restriction, including without limitation the rights to implement the Specification in a software program, deploy the Specification in a network service, and copy, modify, merge, publish, translate, distribute, sublicense, or sell copies of the Specification, and to permit persons to whom the Specification is furnished to do so, subject to the condition that the foregoing copyright notice and this permission notice shall be included in all copies or substantial portions of the Specification. Unless separate permission is granted, modified works that are redistributed shall not contain misleading information regarding the authors, title, number, or publisher of the Specification, and shall not claim endorsement of the modified works by the authors, any organization or project to which the authors belong, or the XMPP Standards Foundation.

Warranty

## NOTE WELL: This Specification is provided on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. ##

Liability

In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall the XMPP Standards Foundation or any author of this Specification be liable for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising from, out of, or in connection with the Specification or the implementation, deployment, or other use of the Specification (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if the XMPP Standards Foundation or such author has been advised of the possibility of such damages.

Conformance

This XMPP Extension Protocol has been contributed in full conformance with the XSF’s Intellectual Property Rights Policy (a copy of which can be found at <https://xmpp.org/about/xsf/ipr-policy> or obtained by writing to XMPP Standards Foundation, P.O. Box 787, Parker, CO 80134 USA).
1 Introduction

Jingle (XEP-0166)\(^1\) defines a way for XMPP agents to establish and control one-to-one media sessions. It is possible for either participant in such a session to also establish additional conversations and then serve as a media mixer. This could be viewed as a classic conference call scenario and is also often referred to as a tightly coupled conference.

Basic participation or hosting of tightly coupled conferences requires no specific protocol support. With the exception of the mixing agent, call members, however, all perceive the session as a regular one-to-one call. They have no way of obtaining additional information about how many and what other users are participating.

The Coin extension (short for Conference Information) allows media mixers to deliver to participants additional information about the status of the call, and that of its members. A conference participant exchanges Coin IQs only with the agent they have established a session with. This means that it can also be used in cases where only a subset of the users on a call are using XMPP while others are connected via alternative mechanisms such as SIP conferencing as defined in RFC 4579\(^2\).

2 Terminology

**Mixer** Throughout this document the term is used to depict an entity that is responsible for mixing and delivering to conference participants both signalling and media. Other specifications refer to mixers and focus agents as two distinct entities but we find this separation to be unnecessary in the current specification and view both as a single logical entity. This entity may be a person hosting the conference and doing the mixing or a dedicated entity to which participants connect in order to establish a conference. For the purposes of this specification, both scenarios are equivalent.

3 Requirements

The extension defined herein is designed to meet the following requirements:

1. Provide a means for mixer agents in tightly coupled conferences to advertise call and member state information to the call participants.

2. Reuse the existing format and XML schema already defined in RFC 4575.

3. Impose no requirements on agents joining the call other than those necessary to establish a regular one-to-one call.

4. Allow straightforward interoperability with other conferencing mechanisms such as RFC 4579 \(^3\) or Multiparty Jingle (XEP-0272) \(^4\)

## 4 How It Works

This section provides a friendly introduction to Coin. In essence Coin allows clients that establish Jingle calls to determine whether their peer is acting as a mixer or to announce themselves as such. This way non-mixer participants would know when they are participating in a conference call and would be able to notify the user accordingly. Once in a call, participants and mixers can use Coin to exchange RFC 4575 \(^5\) conference information indicating what participants are currently on the call and what their status is.

## 5 Creating a conference call

When creating conference calls mixers SHOULD indicate the nature of the call as early as possible. This is necessary in order to allow other participating user agents to adapt their user interface in an appropriate way.

```xml
<iq from='romeo@montague.lit/orchard'
    id='zid615d9'
    to='juliet@capulet.lit/balcony'
    type='set'>
    <jingle xmlns='urn:xmpp:jingle:1'>
        action='session-initiate'
        initiator='romeo@montague.lit/orchard'
        sid='a73sijvkla37jfeaa'>
            <content creator='initiator' name='this-is-a-stub'>
                <description xmlns='urn:xmpp:jingle:apps:stub:0'/>  
            </content>
            <transport xmlns='urn:xmpp:jingle:transports:stub:0'/>
        </jingle>
    <conference-info xmlns='urn:xmpp:coin:1' isfocus='true'/>
</iq>
```

Similarly mixers being dialed by new participants SHOULD indicate the nature of the call by including the <conference-info/> element into the Jingle session-accept message. Finally, when transforming an existing one-to-one session into a conference or vice-versa a mixer SHOULD send a jingle session-info message with the appropriate <conference-info/>

element. Note that presence of the `<conference-info/>` element is only determines whether the party sending it is currently acting as a mixer or not. If multiple peers in a call are independently acting as mixers they should all indicate their status accordingly.

6 Delivering conference information

Once a conference call has been established and advertised as such, a mixer MAY at any point send information describing the state of the call and its current participants.

```xml
<iq from='romeo@montague.lit/orchard'
    id='zd615d9'
    to='juliet@capulet.lit/balcony'
    type='set'>
  <jingle xmlns='urn:xmpp:jingle:1' sid='a73sjjvk1a37jfea'/>
  <conference-info xmlns='urn:ietf:params:xml:ns:conference-info'
                  entity='xmpp:romeo@montague.lit/orchard'
                  state='full'
                  version='1'>
      <!-- CONFERENCE INFO -->
      <conference-description>
        <subject>Ending a relationship</subject>
      </conference-description>
      <!-- CONFERENCE STATE -->
      <conference-state>
        <user-count>3</user-count>
      </conference-state>
      <!-- USERS -->
      <users>
        <user entity='xmpp:romeo@montague.lit' state='full'>
          <display-text>Romeo</display-text>
          <!-- ENDPOINTS -->
          <endpoint entity='xmpp:romeo@montague.lit/orchard'>
            <display-text>Romeo's smartphone</display-text>
            <status>disconnected</status>
            <disconnection-info>
              <when>2011-01-31T20:00:00Z</when>
              <reason>poisoned</reason>
            </disconnection-info>
          </endpoint>
        </user>
      </users>
  </conference-info>
</iq>
```
The IQ message containing the conference info document MAY also contain a jingle element with the session id attribute indicating the session to which the conference information refers to.
7 Determining Support

If an entity supports Coin, it SHOULD advertise that fact by returning a feature of "urn:xmpp:coin:1" in response to a Service Discovery (XEP-0030) information request.

Listing 1: Service Discovery Information Request

```xml
<iq from='kingclaudius@shakespeare.lit/castle'
id='ku6e51v3'
to='laertes@shakespeare.lit/castle'
type='get'>
<query xmlns='http://jabber.org/protocol/disco#info'/>
</iq>
```

Listing 2: Service Discovery Information Response

```xml
<iq from='laertes@shakespeare.lit/castle'
id='ku6e51v3'
to='kingclaudius@shakespeare.lit/castle'
type='result'>
<query xmlns='http://jabber.org/protocol/disco#info'>
<feature var='urn:xmpp:coin:1'/>
</query>
</iq>
```

In order for an application to determine whether an entity supports this protocol, where possible it SHOULD use the dynamic, presence-based profile of service discovery defined in Entity Capabilities (XEP-0115). However, if an application has not received entity capabilities information from an entity, it SHOULD use explicit service discovery instead.

8 Security Considerations

PENDING: RFC 4575 mostly talks about authentication conference-info subscriptions but these are not part of this specification. The authors are hence currently unaware of any other Coin specific security considerations.

9 Open Issues

This document provides a basic description of a simple way to support tightly coupled conference calls. It is in many respects still a stub and a number of open issues require the attention of the community:

---

1. Need to define best practices for user agents to easily determine whether the request of
user to establish a conference call should result in a Muji or a Coin conference.

10 XML Schemas

10.1 Advertising Conf Calls

```xml
<?xml version='1.0' encoding='UTF-8'?>
<xs:schema

    xmlns:xs='http://www.w3.org/2001/XMLSchema'
    targetNamespace='urn:xmpp:coin:1'
    xmlns='urn:xmpp:coin:1'
    elementFormDefault='qualified'>

    <xs:annotation>
        <xs:documentation>
            The protocol documented by this schema is defined in XEP-0298: http://www.xmpp.org/extensions/xep-0298.html
        </xs:documentation>
    </xs:annotation>

    <xs:element name="conference-info" type="empty">
        <xs:complexType>
            <xs:attribute name='isfocus' type='xs:boolean' required='true'/>
        </xs:complexType>
    </xs:element>

</xs:schema>
```

10.2 Conference Info

```xml
<?xml version='1.0' encoding='UTF-8' ?>
<xs:schema

    targetNamespace="urn:ietf:params:xml:ns:conference-info"
    xmlns:tns="urn:ietf:params:xml:ns:conference-info"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:urn:ietf:params:xml:ns:conference-info elementFormDefault="qualified"
    attributeFormDefault="unqualified">

    <xs:annotation>
        <xs:documentation>
        </xs:documentation>
    </xs:annotation>

</xs:schema>
```
<xs:annotation>
