Version 0.1

Status	Type	Short Name
Deferred	Standards Track	NOT_YET_ASSIGNED

This specification defines a way for an XMPP client to request an XMPP server to prep and normalize a given JID.

# Legal

## Copyright

This XMPP Extension Protocol is copyright © 1999 – 2018 by the [XMPP Standards Foundation](#) (XSF).

## Permissions

Permission is hereby granted, free of charge, to any person obtaining a copy of this specification (the "Specification"), to make use of the Specification without restriction, including without limitation the rights to implement the Specification in a software program, deploy the Specification in a network service, and copy, modify, merge, publish, translate, distribute, sublicense, or sell copies of the Specification, and to permit persons to whom the Specification is furnished to do so, subject to the condition that the foregoing copyright notice and this permission notice shall be included in all copies or substantial portions of the Specification. Unless separate permission is granted, modified works that are redistributed shall not contain misleading information regarding the authors, title, number, or publisher of the Specification, and shall not claim endorsement of the modified works by the authors, any organization or project to which the authors belong, or the XMPP Standards Foundation.

## Warranty

## NOTE WELL: This Specification is provided on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. ##

## Liability

In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall the XMPP Standards Foundation or any author of this Specification be liable for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising from, out of, or in connection with the Specification or the implementation, deployment, or other use of the Specification (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if the XMPP Standards Foundation or such author has been advised of the possibility of such damages.

## Conformance

This XMPP Extension Protocol has been contributed in full conformance with the XSF's Intellectual Property Rights Policy (a copy of which can be found at <https://xmpp.org/about/xsf/ipr-policy>) or obtained by writing to XMPP Standards Foundation, P.O. Box 787, Parker, CO 80134 USA).

## 1 Introduction

In order to properly compare and match JIDs, a normalization and prepping step is required by [RFC 6122](#)<sup>1</sup>. The responsibility for such normalization is split between the server and client, where the server is expected to prep any JID slots that it recognizes, particularly those related to stanza routing and roster items. However, the server can not prep JID slots that it does not understand, and so those are left for the client to process.

In some environments (in particular, browser based environments), a client does not have access to the various Unicode and internationalization libraries necessary to properly prep and normalize a JID. For those situations, this protocol defines a way for a client to ask a server to normalize a JID on its behalf.

## 2 Discovering support

If a server supports JID prep queries, it MUST specify the 'urn:xmpp:jidprep:0' feature in its service discovery information features as specified in [Service Discovery \(XEP-0030\)](#)<sup>2</sup> and the Entity Capabilities profile specified in [Entity Capabilities \(XEP-0115\)](#)<sup>3</sup>.

Listing 1: Client checks for support by the server

```
<iq type="get"
  to="capulet.lit"
  from="juliet@capulet.lit/balcony"
  id="info1">
  <query xmlns="http://jabber.org/protocol/disco#info"/>
</iq>
```

Listing 2: Server advertises support for JID prep queries

```
<iq type="result"
  to="juliet@capulet.lit/balcony"
  from="capulet.lit"
  id="info1">
  <query xmlns="http://jabber.org/protocol/disco#info">
    ...
    <feature var="urn:xmpp:jidprep:0"/>
    ...
  </query>
</iq>
```

---

<sup>1</sup>RFC 6122: Extensible Messaging and Presence Protocol (XMPP): Address Format <<http://tools.ietf.org/html/rfc6122>>.

<sup>2</sup>XEP-0030: Service Discovery <<https://xmpp.org/extensions/xep-0030.html>>.

<sup>3</sup>XEP-0115: Entity Capabilities <<https://xmpp.org/extensions/xep-0115.html>>.

The JID prep service MAY be supported through the use of an external component ([Jabber Component Protocol \(XEP-0114\)](#)<sup>4</sup>); in which case, the component MUST return an identity of "component/jidprep" in addition to the "urn:xmpp:jidprep:0" feature.

Listing 3: Server component advertises support for JID prep queries

```
<iq type="result"
  to="juliet@capulet.lit/balcony"
  from="jidprep.capulet.lit"
  id="info2">
  <query xmlns="http://jabber.org/protocol/disco#info">
    <identity category="component" type="jidprep" />
    ...
    <feature var="urn:xmpp:jidprep:0" />
  </query>
</iq>
```

### 3 Use Cases

In order to request prepping for a JID, the client sends an <iq/> stanza of type "get" to the server, containing a <jid/> element qualified by the 'urn:xmpp:jidprep:0' namespace and whose XML character data is the JID in question:

Listing 4: Client requests the server to prep and normalize a JID

```
<iq type="get"
  to="capulet.lit"
  id="prep1">
  <jid xmlns="urn:xmpp:jidprep:0">ROMeo@montague.lit/orchard</jid>
</iq>
```

The server MUST return either an IQ-result or an IQ-error. When returning an IQ-result, the server sends an <iq/> stanza of type='result' containing a <jid/> element qualified by the 'urn:xmpp:jidprep:0' namespace and whose XML character data MUST be the prepped and normalized version of the requested JID:

Listing 5: Server responds with the prepped JID

```
<iq type="result"
  to="juliet@capulet.lit/balcony"
  from="capulet.lit"
  id="prep1">
  <jid xmlns="urn:xmpp:jidprep:0">romeo@montague.lit/orchard</jid>
</iq>
```

<sup>4</sup>XEP-0114: Jabber Component Protocol <<https://xmpp.org/extensions/xep-0114.html>>.

If an IQ-error is returned, then it SHOULD specify an error condition of <jid-malformed/> if the given JID could not be processed to a normalized form:

Listing 6: Server responds with an error for an invalid JID

```
<iq type="error"
  to="juliet@capulet.lit/balcony"
  from="capulet.lit"
  id="prep1">
  <jid xmlns="urn:xmpp:jidprep:0">romeo@@montague.lit/orchard</jid>
  <error type="modify">
    <jid-malformed xmlns="urn:ietf:params:xml:ns:xmpp-stanzas" />
  </error>
</iq>
```

## 4 Implementation Notes

If a client has the ability to perform the prepping and normalization process itself, it SHOULD NOT make a JID prep request to the server.

Upon a successful response, the client SHOULD cache the result, mapping the original JID to the normalized version.

In order to reduce the number of queries made by clients, the server MUST enforce normalization rules for any JID slots understood by the server (e.g. the to and from attributes, roster item JIDs, etc).<sup>5</sup>

## 5 Security Considerations

As the process for normalizing a JID can be resource intensive, there is a possibility for denial of service attacks. A server MAY rate limit the number of requests to prevent such attacks. Likewise, the server MAY only respond to requests from users that are local to the server.

## 6 IANA Considerations

This document requires no interaction with the [Internet Assigned Numbers Authority \(IANA\)](#)<sup>7</sup>.

---

<sup>5</sup>This requirement is intended to be subsumed by the requirements introduced in [rfc6122bis](#)<sup>6</sup>

<sup>7</sup>The Internet Assigned Numbers Authority (IANA) is the central coordinator for the assignment of unique parameter values for Internet protocols, such as port numbers and URI schemes. For further information, see <http://www.iana.org/>.

## 7 XMPP Registrar Considerations

### 7.1 Protocol Namespaces

The [XMPP Registrar](#)<sup>8</sup> includes 'urn:xmpp:jidprep:0' in its registry of protocol namespaces (see <https://xmpp.org/registrar/namespaces.html>).

- urn:xmpp:jidprep:0

### 7.2 Protocol Versioning

If the protocol defined in this specification undergoes a revision that is not fully backwards-compatible with an older version, the XMPP Registrar shall increment the protocol version number found at the end of the XML namespaces defined herein, as described in Section 4 of XEP-0053.

### 7.3 Service Discovery Category/Type

The [XMPP Registrar](#)<sup>9</sup> includes a category of "component" in its registry of Service Discovery identities (see <https://xmpp.org/registrar/disco-categories.html>); as a result of this document, the Registrar includes a type of "jidprep" to that category.

The registry submission is as follows:

```
<category>
  <name>component</name>
  <type>
    <name>jidprep</name>
    <desc>
      A server component that offers a JID prepping
      and normalization service to constrained clients.
    </desc>
    <doc>XEP-0328</doc>
  </type>
</category>
```

## 8 XML Schema

<sup>8</sup>The XMPP Registrar maintains a list of reserved protocol namespaces as well as registries of parameters used in the context of XMPP extension protocols approved by the XMPP Standards Foundation. For further information, see <https://xmpp.org/registrar/>.

<sup>9</sup>The XMPP Registrar maintains a list of reserved protocol namespaces as well as registries of parameters used in the context of XMPP extension protocols approved by the XMPP Standards Foundation. For further information, see <https://xmpp.org/registrar/>.
