1 Introduction

User Avatar (XEP-0084) and vCard-Based Avatars (XEP-0153) are usually considered to stand in competition with each other. XEP-0084 even talks about superseding XEP-0153 in the future. While XEP-0084 provides a more efficient interface to upload avatars by separating metadata and data (thus saving the client from having to download its own avatar on every connect) it has the significant downside of not working with Multi-User Chat (XEP-0045). Server implementations can aid to resolve this conflict by automatically putting avatars uploaded with XEP-0084 into XEP-0153 storage and vice versa. This allows clients to use the more efficient XEP-0084 for uploading avatars and XEP-0153 to retrieve avatars in Multi-User Chats.

2 Discovery

The conversion is transparent to the uploading entity. However an entity might want to discover if a service will be performing the conversion from XEP-0084 to XEP-0153 since using vCard-Based Avatars will make the uploaded avatar publicly available. (See the “Security Considerations” section of this XEP.) The service MUST include a Service Discovery (XEP-0030) feature of "urn:xmpp:pep-vcard-conversion:0" on the account.

Listing 1: Client sends service discovery request to own account

```xml
<iq from='romeo@montague.tld/garden'
     id='01'
     type='get'
     to='romeo@montague.tld'>
  <query xmlns='http://jabber.org/protocol/disco#info'/>
</iq>
```

Listing 2: Server includes feature namespace in response

```xml
<iq from='romeo@montague.tld'
     id='01'
     type='result'
     to='romeo@montague.tld/garden'>
  <query xmlns='http://jabber.org/protocol/disco#info'>
    <feature var='urn:xmpp:pep-vcard-conversion:0'/>
  </query>
</iq>
```

---

3 Conversion

Modern clients are expected to use PEP (XEP-0084) as the interface to upload their avatar and use vCard (XEP-0153) only as a read only fallback. Thus a service MUST support conversion from PEP to vCard. A service MAY support conversion from vCard to PEP in order to display avatars in clients that only support XEP-0084.

3.1 From PEP to vCard

Upon receiving a publication request to the 'urn:xmpp:avatar:metadata' node the service MUST look up the corresponding item published in the 'urn:xmpp:avatar:data' node and store the content of the data element as a photo in the vcard. Services MUST consider the fact that the metadata node might contain multiple info elements and MUST pick the info element that does not point to an external URL. Services SHOULD verify that the SHA-1 hash of the image matches the id.

3.2 From vCard to PEP

Upon receiving a vCard publication request with a valid photo attached to it a service MUST first publish an item to the 'urn:xmpp:avatar:data' node on behalf of the requesting entity. The id of that item MUST be the SHA-1 hash of the image as described in XEP-0084. Afterwards the service MUST publish a new item to the 'urn:xmpp:avatar:metadata' node with one info element that represents the newly published image using the type value from the vCard as a type attribute in the info element. After publication the service SHOULD send out notification messages to all subscribers of the metadata node.

4 Presence Broadcast

The “Business Rules” section of XEP-0153 tells entities to include a hash of the vCard avatar in their presence. However this requires clients to retrieve the avatar on every connect to calculate the hash. To avoid this, services MUST include the hash on behalf of their users in every available presence that does not contain an empty photo element wrapped in an x element qualified by the 'vcard-temp:x:update' namespace. Empty x elements qualified by the 'vcard-temp:x:update' namespace (those without a photo element as child) MUST be overwritten. Presences where the content of the photo element is not empty and not equal to the hash calculated by the service MAY be overwritten.

Listing 3: Client sends presence to server

```
<presence/>
```
6 Security Considerations

XEP-0084 has a default access model that only allows entities with mutual presence subscription to access the published avatar. XEP-0153 has no access control at all. Clients that discover the disco feature ‘urn:xmpp:pep-vcard-conversion:0’ on the account MAY warn users that

5 Implementation Notes

Implementing clients SHOULD use the more efficient XEP-0084 to access their own avatar storage and implement XEP-0153 only to download avatars from other entities if they do not have mutual presence subscription with said entity. (For example participants in a Multi-User Chat.)

Services will inject the hash in directed presences automatically but will not resend the presence if the avatar gets updated. Thus clients MAY resend directed available presence to all Multi-User Chats after receiving a ‘urn:xmpp:avatar:metadata’ update notification. The service will then inject an updated version of the hash. To avoid sending unnecessary presence updates, resending should only occur if the service announces the ‘urn:xmpp:pep-vcard-conversion:0’ feature.

The hash MUST also be injected into directed presences such as MUC joins.

Listing 4: Server forwards presence to other entities that have presence subscription

```
<presence to='juliet@capulet.tld' from='romeo@montague.tld/garden'>
  <x xmlns='vcard-temp:x:update'>
    <photo>sha1-hash-of-image</photo>
  </x>
</presence>
```

Listing 5: Client sends a presence containing an empty photo element

```
<presence>
  <x xmlns='vcard-temp:x:update'>
    <photo/>
  </x>
</presence>
```

Listing 6: The server redirects the presence but doesn’t touch the photo element

```
<presence to='juliet@capulet.tld' from='romeo@montague.tld/garden'>
  <x xmlns='vcard-temp:x:update'>
    <photo/>
  </x>
</presence>
```
uploading an avatar will make that avatar accessible to anyone who knows the Jabber ID.
In the future services MAY decide to perform PEP to vCard conversion only if the access
model of the 'urn:xmpp:avatar:data' node has been set to 'open' as described in Publish-
Subscribe (XEP-0060) ⁵. However the ability to change the access model of nodes isn’t widely
implemented yet and thus this paragraph exists only to act as a reminder that the privacy
implications described in the previous paragraph can be avoided

7 IANA Considerations

This document requires no interaction with the Internet Assigned Numbers Authority (IANA).

8 XMPP Registrar Considerations

This specification defines the following XML namespace:

• urn:xmpp:pep-vcard-conversion:0

9 XML Schema

tbd
