1 Introduction

This specification provides a way to request invite tokens to a MUC room in order to invite users whose address is unknown to a member-only Multi-User Chat (XEP-0045) room.

2 Requirements

- Allow tokens to be generated, optionally with constraints.
- Allow tokens to be revoked.
- Don’t prevent affiliated users of a room to join if they don’t possess a token.
- Don’t require clients receiving tokens to have any specific implementation.

3 Use Cases

3.1 Discovering support

Supporting entities MUST advertise the urn:xmpp:muc-token-invite:0 Service Discovery (XEP-0030) feature.

3.2 Token generation

An entity may request a token from a Multi-User Chat (XEP-0045) service by sending an iq of type set containing a <request> element in the urn:xmpp:muc-token-invite:0 namespace.

Listing 1: Requesting an invitation token

```
<iq type='set' to='news@commons.example.org' id='request1'>
  <request xmlns='urn:xmpp:muc-token-invite:0'/>
</iq>
```

The MUC room MUST reply to the request with a <token> element in the urn:xmpp:muc-token-invite:0 namespace, containing the token as text node. The token MUST be an opaque string but does not need to be unique within a room.

Listing 2: Room successfully replies with a token

```
<iq type='result' from='news@commons.example.org' to='louise@example.org' id='request1'>
</iq>
```

---

---
Implementations MUST reply an error of type auth/forbidden if the requesting entity isn’t allowed to generate a token.

Listing 3: Room replies with an error because user lacks permissions

```xml
<iq type='result' from='news@commons.example.org' to='louise@example.org' id='request1'>
  <error type='auth'>
    <forbidden xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
```

3.3 Limits

It is possible to create tokens that may be used only a specific number of times to grant users affiliations, and/or may have an expiry time.

To constrain the token to a number of times after which it expires, the counter attribute (xs:unsignedInt) can be used in the `<request>` element.

To constrain the token to a time limit, the delay attribute (xs:unsignedInt) can be used in the `<request>` element.

If both attributes are combined, whichever constraint is reached first expires the token.

Listing 4: A client requests a token with a month time limit and 5 users

```xml
<iq type='set' to='news@commons.example.org' id='request2'>
  <request xmlns='urn:xmpp:muc-token-invite:0' delay='2678400' counter='5'/>
</iq>
```

The reply from the service MUST contain at least the requested delay and counter attributes. Requested values for these attributes MAY be altered by the server. This may be useful to implement a default server policy (maximum time, and/or counter). Values returned indicate current values that apply to the issued token.

Services may want to automatically limit issued tokens even with the request doesn’t have any. In the following example, the MUC service enforces a maximum time limit of a week as a policy.

Listing 5: Reply from the room

```xml
<iq type='result' from='news@commons.example.org' to='louise@example.org' id='request2'>
  <token xmlns='urn:xmpp:muc-token-invite:0'
         delay='604800'/>
</iq>
```
3 USE CASES

counter='5'  
>1yQZ1RzacYTlf3svGODYq1xVabNnMc2x</token>
</iq>

3.4 Inviting users
Integration with Mediated Invites or Direct MUC Invitations (XEP-0249) ¹ is not described in this document as invite tokens generated this way may not be used when the invitee's address is known. Clients may include generated tokens in the password parameter of a URI as such:

Listing 6: URI with an invite token

```
xmpp:news@commons.example?join;password=TOKEN
```

3.5 Using a token
Receiving entities will follow the usual flow of joining password protected rooms. When a token is used by a participant who doesn’t have any affiliation, a server MUST give them an affiliation level of member. If an expired token is used by someone who isn’t affiliated yet, the room MAY additionally include in the presence error an <expired-token/> element in the urn:xmpp:muc-token-invite:0 namespace, as a sibling of the <not-authorized/> element.

3.6 Listing tokens
It is possible for room participants to list tokens by sending an iq of type get containing a <tokens/> element in the urn:xmpp:muc-token-invite:0 namespace. The room MUST reply with all tokens that the participant is allowed to revoke, each listed in <token> elements within a <tokens> wrapper element. Individual token elements MUST contain updated attribute values, that is, if a token has been issued with counter set to 5 and has been used twice (2), listing tokens at this point will show this specific token with a counter attribute value of 3.

Listing 7: Requesting the token list

```
<iq type='get' to='news@commons.example.org' id='request3'>
  <tokens xmlns='urn:xmpp:muc-token-invite:0'/>
</iq>

<iq type='result' to='louise@example.org' id='request3'>
  <tokens xmlns='urn:xmpp:muc-token-invite:0'/>
</iq>
```

3.7 Revoking a token

It is possible to revoke a token early by sending an iq containing a <revoke> element in the urn:xmpp:muc-token-invite:0 namespace, with the token as the text node. The room MUST then reply successfully with an empty iq.

If the user is unauthorized to issue tokens, the room should reply with an iq error type auth/forbidden. If the user is unauthorized to revoke the specified token, or if the token doesn’t exist, the room should reply with an iq error of type cancel/item-not-found.

Listing 8: A client revokes a token
```
<iq type='set' to='news@commons.example.org' id='request4'>
  <revoke xmlns='urn:xmpp:muc-token-invite:0'>
    lyQZ1RzacYTlf3svGODYq1xVabNnMc2x
  </revoke>
</iq>
```

Listing 9: The revocation succeeds
```
<iq type='result' to='louise@example.org' id='request4'/>
```

Listing 10: The revocation fails because the user is not allowed to revoke specified token
```
<iq type='result' to='louise@example.org' id='request4'>
  <error type='cancel'>
    <item-not-found xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
```

4 Implementation Notes

Tokens may be added to bookmark storage by receiving entities and as such implementing MUC rooms SHOULD ignore tokens provided during join when a user is already affiliated with the room. In this case, if a counter was attached it SHOULD NOT be decremented.

Tokens with no constraint are not equivalent to passwords. A token is only required to be supplied once as opposed to passwords, which need to be specified at every join independently of user affiliation.

The Using a token section describes a way for clients to know they may have used an invalid token by adding an error specific to this document. It is likely that tokens aren’t stored indefinitely but rather removed from storage not long after they expire, which makes it
hard for MUC services to distinguish between a password for the room before configuration change, and an expired token. This specification assumes that it was an expired token as the room isn’t password protected.
Possible extensions to this spec could include broadcasting information about the inviter in a new participant’s join presence, as well as issuing tokens with specific affiliations and/or Hats (XEP-0317) ⁵.

5 Accessibility Considerations

None?

6 Internationalization Considerations

None?

7 Security Considerations

Leaking tokens may lead to inviting unwelcomed people to a room. Token limits and revocations provide users a way to reduce harm in such a case. A service SHOULD also enforce a reasonable maximum value as a time or usage constraint (24h, a week, a year, etc.). Issuing tokens may be locked down by service operators, or by room administrators via the muc#roomconfig_allowinvites Multi-User Chat (XEP-0045) ⁶ configuration option. It is RECOMMENDED that room moderators be able to list and revoke tokens generated by every other participant.

8 IANA Considerations

None.

9 XMPP Registrar Considerations

None.
